

# THINGS THAT MAY AFFECT INTERNET CONNECTION SPEED.

1

## Devices can cause interference

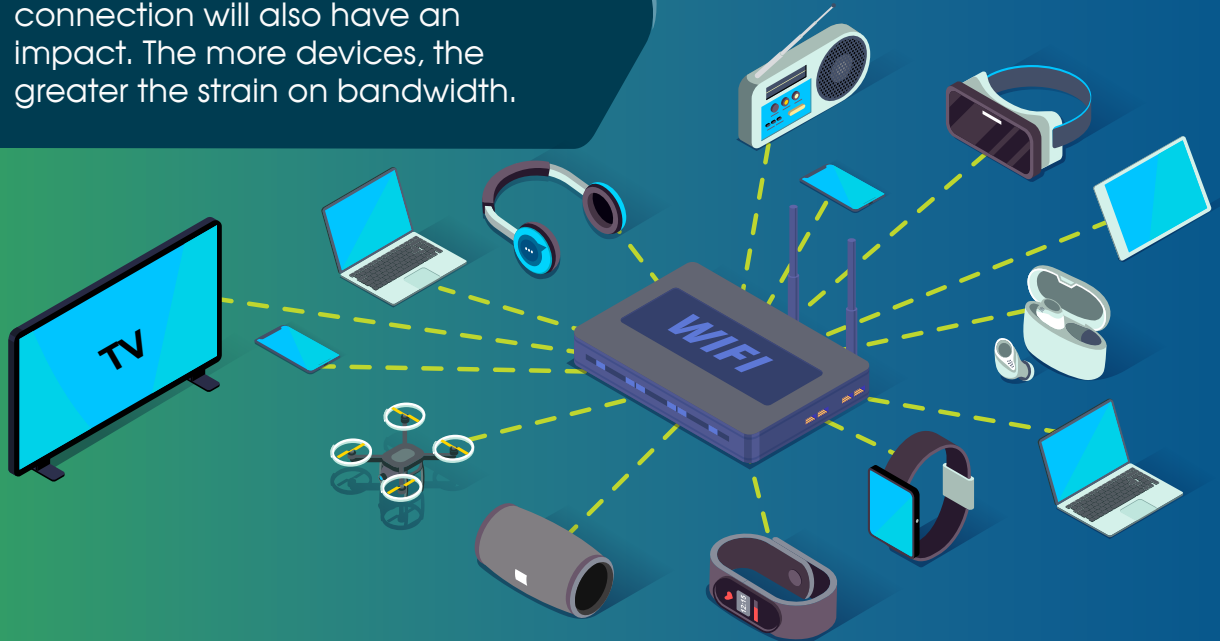

If you're using Wi-fi, then appliances, cordless phones, and baby monitors can cause interference. The same is true for building materials such as concrete, metal, or heavy timber.

2

## The number of devices

within your home sharing your Wi-fi connection will also have an impact. The more devices, the greater the strain on bandwidth.

# THINGS THAT MAY AFFECT INTERNET CONNECTION SPEED.

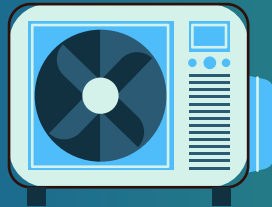

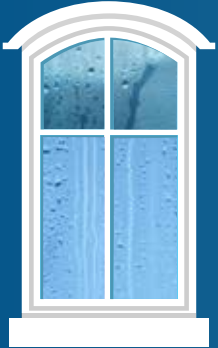

3

If you moved the router from where it was originally installed in your home, try returning it to its original location. The placement of the router can affect Wi-fi in your home.

Check to ensure that your  
**modem or  
router location**  
is in a cool place, away  
from heat.

4

5

An older computer or device  
may be the cause of poor performance,  
despite the speed of the Internet connection.
